

LEX L11 OEMCONFIG RELEASE NOTES

Version 9.13
November 2020

LEX L11 OEMConfig Overview

LEX L11 OEMConfig is an administrative application for configuring Motorola Solutions LEX L11 Android devices using [Android Managed Configurations](#). It provides an interface for Enterprise Mobility Management (EMM) administrators to set custom LEX L11 policies and configure device features for which no Android Enterprise API is available.

LEX OEMConfig app and associated schema is published as a public app to the managed Google Play Store and it is available from the EMM console. The app and the schema must be used together to configure LEX L11 Android devices from the EMM console. The schema defines the functions available for configuration and provides the data necessary to present the corresponding data-driven UI for configuring those functions. This mechanism allows Motorola Solutions to make a new schema available as soon as new LEX L11 features are available for use.

Device Support

- Supports all LEX L11 devices running Android 9.0

New Features in v9.13
