

Access Control Manager (ACM) System ACM VerifyTM Browser

The ACM Verify interface allows any browser-enabled smart device to act as a virtual station. It works by recording and confirming an individual's identity using a PIN code, enabling you to extend the capability of your access system to locations where physical access doors are not feasible.

Scenarios for the ACM Verify Browser

- Record personnel remotely as they report to mustering locations
- Track attendance at company meetings, training sessions and events
- Monitor students during field trips and school drills
- Record homeroom attendance and teacher in/out status
- Add virtual stations to any temporary location, such as a construction site

KEY FEATURES	BENEFITS
Browser-Enabled	Simply navigate to the ACM Verify interface from any browser-enabled device.
Device Pairing	Easily link a device to a virtual station for a higher level of security.
PIN Code Activated	Enter a PIN code to quickly record personnel.
Profile Verification	Quickly compare a person's appearance with the saved database image.
Event Reporting	Send verification events to the ACM TM system and view a list of recorded personnel for each virtual station.
Event Triggering	Activate global actions from events generated by virtual stations.
Install/Uninstall	Easily enable or disable virtual stations from the ACM system.

Ordering

- **AC-SW-AVO-VER-5VS:**
License for 5 virtual stations
- **AC-SW-AVO-VER-16VS:**
License for 16 virtual stations

Compatibility

- ACM Professional, Enterprise and Virtual (version 5.10.2 and above)
- The first virtual station license is included in the above listed versions
