

Flex EagleView Map Interface

View a structure from multiple angles and measure its dimensions on an electronic map

Multi-angle viewing

The EagleView Map Interface allows users to view an image from multiple perspectives using oblique imagery, or high-resolution aerial photography captured at a 45-degree angle, allowing both the top and sides of objects to be visible. Map images can be viewed from the north, south, east, west and from directly above. The ability to view a structure from various angles enables users to quickly determine the size of the structure, identify potential barriers or hazards and view entrances or exits.

Electronic measurements

EagleView Map users can easily measure the height, area, pitch and distance of an object using a computer mouse. The ability to easily conduct measurements allows field personnel to arrive on-scene with critical information. For example, firefighters can use EagleView Map to determine how tall a structure is and what size of ladders are needed. They can measure the distance from a water source to the fire to know the length of hose needed, as well as determine whether a fire apparatus can be driven under bridges or overpasses.

Navigating the EagleView Map Interface

Using Flex's EagleView Map Interface, users can **view an object from multiple perspectives**, measure its dimensions on an electronic map, and add annotations.

Some agencies may already have access to EagleView Map imagery for their jurisdictions. These agencies will only require the Flex interface, which allows them to integrate their existing EagleView images with Flex's mapping software, take measurements and view objects on the map from multiple perspectives. Agencies without EagleView imagery will need to purchase both Flex's EagleView Map Interface and EagleView imagery of their jurisdictions. For more information, contact your Flex sales representative.

Total software integration

Flex's Integrated Hub™ is an open, centralized database where all agency information is entered, stored and extracted in real time, providing total software integration. This allows users to enter data once and have it automatically shared among related modules. Agencies using this module can optimize their system and enhance productivity through total integration with other Flex modules.
